METHOD, SYSTEM, AND PROGRAM FOR TRANSFORMING FILES FROM A SOURCE FILE FORMAT TO A DESTINATION FILE FORMAT

ABSTRACT

Provided is a method, system, and program for transforming files from a source

5   file format to a destination file format. A data structure is generated in a computer readable medium indicating available transforms from a plurality of source file formats to at least one destination file format. A graphical representation of available transforms from the source file formats to the at least one destination file format is generated based on the available transforms indicated in the data structure. User input is received

10   indicating a selected source file having a source file format and a selected destination file having a selected destination file format, wherein the data structure indicates one available transform to transform the selected source file format to the selected destination file format. The selected source file in the source file format is transformed to the selected destination file in the destination file format.
